4 A program contains a global 1D array `Number` consisting of 20 elements of type `REAL`

A procedure `Store()` will input a sequence of up to 20 real values, one value at a time. These values will be assigned to elements of the array using four steps:

Step 1: store the first value in the sequence in the first element of the array
Step 2: check each subsequent value input. If this value is larger than the previous value input, then assign the value to the next array element, otherwise go to **step 4**
Step 3: repeat from **step 2** unless the array is full
Step 4: output the count of the number of values stored in the array together with a suitable message.

(a) Complete the pseudocode for `Store()`

All variables used in the algorithm must be declared.

```
PROCEDURE Store()
```

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

.....

```
ENDPROCEDURE
```

[6]

(b) The requirements of the program change:

- the number of values in the sequence is unknown, but may be higher than 20
- the values will need to be accessed by another program as data.

The data will be stored in a text file instead of an array.

(i) Give **two** benefits of using a text file instead of an array.

1 .....

.....

2 .....

.....

[2]

(ii) State any change that will need to be made before each value is written to the file.

.....

..... [1]
